Self-Assessment – Seminar Paper and Presentation

Technische Hochschule Ingolstadt

User Experience Design (M.Sc.) · Mobile UX Prototyping · Prof. Dr. Simon Nestler · Winter term 2026/27

This sheet is your self-check before submission and before the final presentation. The criteria below are the real grading anchors of the course; only the stakes are simulated. Check them honestly. A gap you name yourself can still be fixed before submission or defended in the final presentation. The real grade weights the parts as follows: Part A 20 points, Part B 20, Part C 30, the seminar paper 30 – out of 100. All five exercise sheets U1–U5 go into the seminar paper, which is why the criteria below reach back to them.

Part 1 · The seminar paper (about 5,000 words)

Go through your draft criterion by criterion. Note in each box *where* in your paper the criterion is met (chapter, page), or what is missing.

S1 · Market claims carry sources. *Every market claim carries a source and a year – or is labeled as an assumption.* Labeled assumptions are legitimate; unlabeled ones cost points.

S2 · Patterns named with sources. The analysis chapter is organized along your team's pattern families (navigation, forms and feedback, plus search in a team of four); every pattern naming carries a source (Tidwell / HIG / Material / Mobbin, with access date).

S3 · Findings ranked by severity. Top findings are ranked by severity with the group-built rubric (as versioned in Moodle), and the strain line is there: where the rubric strained on your case.

S4 · The fidelity decision holds. The four elements of your fidelity block from exercise sheet 02 – design question, fidelity level, rule-based reasoning, and the self-named blind spot – stand in the paper, as you presented them in Part B. The blind spot you named yourself counts toward the grade.

S5 · Discards documented. The *Discarded alternatives* chapter demonstrably feeds from your iteration protocols, the same discards you showed in Part B.

S6 · The audit element is answered. Every auditor finding is accepted or refuted *in writing*, each answer anchored (rubric line or context criterion); a refutation is argued; nothing is left unanswered.

S7 · The friction inventory exists. The concept chapter contains a friction inventory: deliberate frictions and whom they protect, removed frictions and what they cost. "No friction present" is inadmissible.

S8 · The notification decision is reasoned. *If your project takes this up:* its notification decision (including the decision *against* notifications) is reasoned along the four building blocks, and the renunciation sentence ("We do not notify when …") is there.

S9 · The offline capability is checked. The concept's offline capability is checked carefully against Exercise U5: what survives offline, what breaks, and how the user sees it. Unvalidated conflict-UX claims carry the label *design rationale, unvalidated*.

S10 · Dark-pattern findings are filed triply. *If your project takes this up:* every dark-pattern finding carries the triple filing (taxonomy, legal anchor, your verdict), with the three levels kept apart. Your verdict is not graded; its clean separation from naming and legal anchor is.

S11 · Pending stays pending. Ongoing proceedings carry the label *pending*; a claim about the outcome of a pending case is a source error, like an invented study.

S12 · The outlook is dated and falsifiable. The outlook chapter is built like the final task (dated prediction): predictions dated and sourced, counter-evidence included, falsification criterion named, evidence types labeled.

Part 2 · The presentation (30 minutes)

These four rows are the anchor sheet of the presentation half. It is in Moodle, and it is identical in Part C. Run the self-check aloud, with a timer, against your own slides.

P1 · Trace visible. Your answers name decisions, discards and prices, with details from your own iteration protocol.

P2 · Anatomy complete. Claim → evidence → limit → price, for every core decision. Every follow-up question sorts into one of the four links.

P3 · Moderation active. You moderate the discussion: acknowledge and sort, answer the strongest reading, park politely and actually return.

P4 · The hardest objection handled. You can answer the price question ("What did your decision cost?") and your own fear question concretely, from the protocol, with your discards at hand.

Self-assessment

1. Compare each criterion (S1–S12, P1–P4) with your draft and score it: **2** = holds, and would survive a follow-up question · **1** = present, but would tip under a follow-up · **0** = missing.
2. Add up your points (maximum: 32). If your project does not take up S8 or S10, leave that criterion out and lower the maximum by 2 for each one; then work with the percentage.
3. Convert to percent with the factor 3.125 (= 100 / 32).
4. Assign an indicative grade using the grade table. The grade is indicative only: the final presentation tests the trace live, and the real grade weights the parts differently from this sheet (A 20 · B 20 · C 30 · paper 30 = 100 points).

Grade table

Grade	from %	to %
1.0	96	100
1.3	91	95
1.7	86	90
2.0	81	85
2.3	76	80
2.7	70	75

3.0	65	69
3.3	60	64
3.7	55	59
4.0	50	54
5.0	0	49

Points	Percent	Indicative grade

What to fix before submission

Take your three lowest-scoring criteria. For each: the criterion, the one concrete change, and where the material already exists (iteration protocol, exercise sheet, audit response, anchor sheet).

Fix 1 – criterion · change · source material:

Fix 2 – criterion · change · source material:

Fix 3 – criterion · change · source material:

Confirmation of the self-assessment

The final step: by writing my name in block letters, I confirm that I have assessed my work fairly and to the best of my knowledge.

Name (block letters)	Date
