Mock Final Presentation

Technische Hochschule Ingolstadt

User Experience Design (M.Sc.) · Mobile UX Prototyping · Prof. Dr. Simon Nestler · Winter term 2026/27

No written exam. The assessment of this module is a **seminar paper** (about 5,000 words, due Friday, 15 January 2027) plus a **presentation** staged in three parts: **Part A** in Exercise U2 (15 minutes with the lecturer, in your team: the results of Exercise U1), **Part B** in Exercise U4 (15 minutes in your team: the results of Exercises U2 and U3, including your fidelity block and the *discarded alternatives* from your iteration protocol) and **Part C**, the **final presentation** (15–20 minutes talk plus discussion, in front of your whole exercise group, on 21 December or 11 January), for which the whole exercise track U1–U5 is relevant. All five exercise sheets also go into the seminar paper. Points: 20 for A, 20 for B, 30 for C and 30 for the paper. In the final presentation your team defends the decisions your paper and your protocols record. There is no rehearsal session in the timetable: you hold this mock round on your own, outside lectures and exercises, with any two teams of three (six people).

The open pool: The real question pool is in Moodle, openly visible, and grows until the freeze date; the questions below are the curated core behind it. No question in the final presentation comes from outside this pool or your own material. Notification strategy, offline UX and dark patterns get their own section at the end; those questions can go to every team.

AI role: The final presentation runs without AI, and so does this rehearsal. Before the round you may test pool questions against a model; during the round nobody uses one.

The real format – what you rehearse for

- **30 minutes are yours**, including the discussion: 15–20 minutes focused talk, the rest a professional discussion that you *moderate*.
- The grading frame of the presentation half is **the anchor sheet**. It is in Moodle, and it is identical in Part C: trace visible? · anatomy complete (claim/evidence/limit/price)? · moderation active? · handling of the hardest objection?
- Every follow-up question sorts into one link of **the anatomy of a defense**: claim → evidence → limit → price. Prepare all four links for each core decision.
- **The three question types** are disclosed: *"Why not otherwise?"* (tests the price) · *"What if X changes?"* (tests the limit) · *"How would you notice you were wrong?"* (tests the evidence). All three will occur.

One practice round – two teams of three

Roles: one **presenting team** (three people, sharing the talk as you would for real) · one **questioning team** (three people, drawing from the pool below and from the fear-question stack). No separate moderator – in the real Part C, moderating the discussion is the presenting team's own job, so it is here too.

Timing (per cycle, ~20 minutes, then swap):

- **8 minutes presentation:** the team presents its core-argument slide and project, splitting the time between its three members however it chooses.
- **8 minutes discussion:** the questioning team asks, any member of the presenting team may answer – but every member must answer at least one question before time is up.
- **4 minutes feedback** along the anchor sheet. The sheet goes to the presenting team; this feedback is formative and not graded.

Swap: the questioning team becomes the presenting team. With more than six people, form several teams of three and rotate which pair meets each cycle.

Stage directions:

- At least **one fear question per round** is mandatory, so the team meets it here before meeting it in Part C.
- Questioning team: after each answer, follow up with one of the three question types and name (to yourselves) which anatomy link it targets.
- Presenting team: moderation is three moves, shared across the team, not owned by one person. Acknowledge and sort ("that is two questions – the harder one first") · answer the *strongest* reading of the question · park politely and actually return. The anchor sheet grades moderation as a team performance.

- Catalog questions marked *(individual)* are tied to one person's own material (their claim, their protocol) – the questioning team directs these at whichever team member owns that material; the other two answer everything else.
- Defenses most often tip at the **price question**. Teams that go silent there usually have no discards at hand, so bring your iteration protocol.
- Fewer than six people available: run the round as a team self-check against an empty chair, aloud, with a timer.

The question catalog

Grouped along the anatomy of a defense. Questions marked *(individual)* are asked with *your* material: your project, your protocol, your submitted sentences. Each question carries a short expected-answer horizon, i.e. what a strong answer contains.

1 · Claims and evidence

- **"Which of your market claims is the shakiest?"** *(individual)* – Strong: names one of your own claims, applies the three-part criterion, formulates the tipping condition.
- **"Name the pattern and the family – and what breaks if you swap it?"** (with a screenshot) – Strong: pattern + family + recognition feature; the follow-on cost of swapping named.
- **"Here is a pattern break. Innovation or error? Name the price of your verdict."** – Strong: one of the three legitimate reasons for breaking checked; price explicit. A verdict without a price counts as incomplete.
- **"Three findings, given. Order them by severity and defend the order."** – Strong: severity formula applied; the affected-persons footnote spotted if the accessibility distractor is included.
- **"Two screens, one machine-made. Which, and what gave it away?"** – Strong: first second vs. third minute as the frame. Admissible: "not at first glance – at the third minute", with a context question as evidence.
- **"Your auditor found X. Accept or refute."** *(individual)* – Strong: every answer anchored (rubric line or context criterion), a refutation argued, nothing left unanswered.

2 · Limits and prices

- **"What did your decision cost?"** *(individual, asked in every defense)* – Strong: the discarded alternative concrete, with protocol lines from Exercise U3; the price named. Silence here is the most common tipping point.
- **"A design question, four fidelities: pick one, name what it cannot show."** – Strong: decision rule applied, blind spot concrete, price named.
- **"Why would a paper prototype not have answered your question?"** *(individual, the final-presentation classic)* – Strong: the level's lies named (paper lies about timing, gestures, data), tied to your own design question.
- **"Why did you discard the reduced variant?"** *(individual)* – Strong: a protocol line as evidence; the reason carries; the discarded thing exists.
- **"You named X as your weakness – defend it now."** *(individual)* – Strong: the structure equation position → evidence → weakness → counter-argument held; the self-named weakness kept and defended.

3 · Method and the machine

- **"Which two claims are wrong, and how could you have recognized it *without* research?"** (with a paragraph of an AI market analysis) – Strong: uniform confidence vs. variable reliability as the recognition logic; aggregator recycling named.
- **"Here are three rubric criteria. Which fourth is missing for THIS case – and why?"** – Strong: reversibility, trust damage or affected-persons weighting added case-dependently.
- **"Name one finding a checklist cannot produce – and the knowledge it required."** – Strong: division of labor frequent/expensive; the kind of context knowledge named (people, incident, constraint).
- **"What has the machine overlooked – and how could you have recognized it without a user test?"** *(individual)* – Strong: interaction patterns and context knowledge as the test instances; the plausible-but-wrong spot located.

4 · Transfer and outlook

- **"One argument from the hearing that survives in your seminar paper – and one that you now distrust."** *(individual)* – Strong: listening beyond your own camp, a reason in each direction; "pending stays pending" without error.
- **"A prediction about mobile UX, undated and unsourced: date it, source it, or discard it."** – Strong: the three test questions (who says it / what falsifies it / what does it mean for your design), evidence-type map applied.
- **"Which decision would you take differently today, and what did it cost?"** *(individual)* – Strong: a real decision, a real revision, the price of the original choice named.

5 · Notifications, offline, dark patterns

These questions are part of the pool and can go to every team: every concept is checked for its offline capability (self-assessment S9), notifications and dark patterns are focal points of the seminar paper (S8, S10), and Part C draws on sheets U4 and U5 like on the rest of the track.

- **"Your app stays silent when …? Defend the silence."** *(individual)* – Strong: the renunciation sentence from your own concept, the engagement price named, courage distinguished from alibi ("at night" alone is not enough).
- **"Your budget allows one push today. Two occasions compete: [two occasions from your project]. Decide and name the loser's cost."** *(individual)* – Strong: a decision with a criterion; the price of the decision explicit.
- **"Same conflict, three data types – which resolution is negligent where?"** – Strong: strategy follows data type; the honesty principle (a silent lossy merge is an interface lie); the fourth strategy (blocking) known.
- **"Name the one function of your app that honestly need not survive offline – and whose interests decided that."** *(individual)* – Strong: triage as a decision, and cost awareness: offline capability buys conflict risk.
- **"Here is a pattern. Name it (taxonomy), then judge it (your line) – two different acts."** – Strong: Brignull type + Gray level, then a *separate* verdict with a criterion. Mixing the two acts is the failure mode.
- **"File this pattern: taxonomy, legal anchor, your verdict – three levels, kept apart."** – Strong: norm assignment argued (DSA 25 / UCPD / GDPR / Data Act 6), legal state correct including *pending* for ongoing cases.

The remaining pool questions, including those your own cohort wrote in the task inversion, live in Moodle and grow until the freeze date. If a model answers a question well, it only tests knowledge: rebuild it until the answer needs material from your own project.
